

With `new_paragraph` we can start a paragraph. Thanks to smart whitespace handling, we do not need to add whitespace between text fragments from different calls to `add_text` or `new_paragraph` calls. If we have extra whitespace, it will be consolidated into a single space.

With `new_paragraph` we can start another paragraph. With `smart_ws=False` the whitespace between text fragments will be preserved. So we can have no whitespace or multiple spaces between text fragments if we want to. We can at any time switch on smart whitespace handling by omitting the `smart_ws=False` argument, or by explicitly setting `smart_ws=True`.

(As this example does not have a heading the generated markdown file will not have a heading. If `markdownlint` is used on the generated markdown file it will report an error for the missing heading.)
